

VISION AND SCOPE DOCUMENT

Project: Job Board Platform

1. Business Requirements:

Business requirements describe the project's ultimate value for its stakeholders and form the foundation on which all user, functional, and non-functional requirements are built.

1.1 Background:

The Job Board project originates from a common, recurring problem in the hiring process: Finding a job, or finding the right person for a job, can be more difficult than it should be. Job seekers often spend hours going through different platforms, only to come across outdated listings, fake companies, or jobs that are no longer available. At the same time, companies have to deal with hundreds of applications, many from candidates who may not even be a good fit for the position. This makes the hiring process slow, confusing, and frustrating for everyone involved. That's why we built the Job Board a platform designed to make the process simpler and more trustworthy. Companies are verified before they can post jobs, while applications are organized and easy to track, helping both employers and job seekers find the right match with more confidence.

1.2 Business Opportunities:

The main opportunity is to create a hiring platform where trust and organization are part of the system from the start. Before a company can post a job, it must be verified by an administrator. This helps reduce fake companies, misleading job posts, and low-quality listings. For job seekers, the platform provides a simple and organized way to apply, including uploading a resume and adding relevant skills instead of relying on random emails or basic forms.

The Job Board also addresses several common problems in the hiring process. It gives job seekers and companies a single place to connect, makes it easier to find candidates based on their skills, and gives

company representatives a clearer view of their applicants without having to manually sort through every application.

The platform is mainly designed for:

- Job seekers who want a simple and reliable way to find and apply for relevant jobs.
- Small and medium-sized companies that need an affordable way to post jobs and manage applications without using complicated HR software.
- Organizations that want a safer hiring environment where companies and candidates can be verified and trusted.

1.3 Business Objectives:

- Make job searching faster and easier by providing search, filtering, and skills-based matching so job seekers can quickly find suitable opportunities.
- Reduce fake and low-quality job postings by making company verification mandatory before a company can post a job.
- Make the application process simpler by allowing users to reuse their profiles and easily attach their resumes when applying for jobs.
- Reduce the workload for company representatives by keeping applications, resumes, and application statuses organized in a single dashboard.
- Provide a secure and reliable platform with role-based access that can support more companies and job seekers as the platform grows.

1.4 Success Metrics:

The success of the Job Board will be measured through the following points:

- Number of registered job seekers and verified companies and how these numbers grow over time.
- Number of jobs posted and applications submitted each month.
- Company verification time, including how many companies are successfully verified within the expected time.
- Time taken to receive the first suitable application after a job is posted.
- System performance and availability, including uptime and average API response time during normal usage.
- Reduction in complaints and support requests related to fake job postings, spam, or irrelevant applications.

1.5 Vision Statement:

For Job Seekers and Companies Who need a simple and trustworthy way to connect for hiring, **The Job Board** Is a web-based recruitment platform. That provides secure, role-based registration, admin-verified company listings, searchable job postings, structured applications with resume uploads, and skills-based matching between candidates and available jobs. Unlike manual hiring processes and unverified job listing websites,

Our product makes the hiring process more reliable by verifying companies before they can post jobs and keeping applications organized and easy to track. This helps job seekers save time when looking for suitable opportunities and makes it easier for employers to manage and review applications through a secure and reliable platform.

1.6 Business Risks:

- **Marketplace competition:** Established job portals already have a large number of users and strong brand recognition, which may make it difficult for a new platform to attract users at the beginning.
- **User acceptance:** Job seekers and companies may prefer the platforms and tools they already use. They may be hesitant to switch unless the Job Board provides clear benefits and a better experience.
- **Implementation issues:** The system may depend on third-party services such as email services, OAuth, and hosting. Incorrect configuration or problems with these services could cause downtime or service failures.
- **Data security risks:** The platform will handle sensitive information such as resumes, personal details, and company information. Any security issue or data breach could negatively affect user trust.
- **Low initial activity:** At the beginning, there may not be enough companies posting jobs or enough job seekers applying. If one side of the platform has low activity, the other side may also have less reason to use it.

1.7 Business Assumptions and Dependencies:

Assumptions:

- Companies will be willing to complete the admin verification process before posting jobs on the platform.
- Job seekers and companies will have regular access to the internet and a modern web browser.
- Users will be comfortable creating accounts and providing correct and up-to-date profile or company information.

Dependencies:

- A reliable email service will be required for sending notifications, account verification emails, and password reset emails.
- Google Sign-In will be used as a third-party authentication option to make registration and login easier for users.
- Cloud hosting, database, backend, and frontend services must remain available and properly configured for the platform to work smoothly.
- Admins need to be available to review and verify pending companies within a reasonable amount of time.

2. Scope and Limitations:

Scope and limitations define what the Job Board will and will not provide. Every feature included supports one of the business objectives defined above; features excluded from this release are explicitly listed to prevent scope creep and manage stakeholder expectations.

2.1 Major Features:

- **Role-based registration and login:** Users can register and log in according to their roles, including Job Seekers, Company Representatives, and Admins. Google Sign-In will also be available for easier login.
- **Company verification:** Companies can register on the platform, but they must be verified by an admin before they are allowed to post jobs.
- **Job management:** Company Representatives can create, edit, and manage their job postings.
- **Job search and filtering:** Job Seekers can browse available jobs and use filters such as job title, location, and employment type to find suitable opportunities.
- **Job applications:** Job Seekers can apply for jobs by submitting their application and uploading their resume. They can also track the status of their applications.
- **Applicant management:** Company Representatives can review applications, accept or reject candidates, and manage applicants through the platform.
- **Skills-based matching:** Job Seekers can add their skills to their profiles, which can be used to match them with jobs that require similar skills.
- **Admin dashboard:** Admins can use a central dashboard to verify companies and manage users, jobs, and skills.
- **Email notifications:** Users will receive email notifications for important events such as application status updates and password resets.

2.2 Scope of Initial Release:

The initial release will include the main features needed to make the Job Board fully usable for all three user roles:

- **Account registration and login:** Users from all three roles can create accounts and log in with access based on their assigned role.
- **Company registration and verification:** Companies can register on the platform and must be verified by an admin before they can post jobs.
- **Job management:** Users can post, browse, search, and filter job listings based on available criteria.
- **Job applications:** Job Seekers can apply for jobs by uploading their resumes and can track the status of their applications.
- **Basic skills management:** Job Seekers can add skills to their profiles, while skills can also be added to job postings to help with matching.
- **Admin dashboard:** Admins can verify companies and manage users and job postings from the dashboard.
- **Core security:** The first release will include JWT-based authentication, role-based access, and secure password handling to keep user accounts and platform data protected.

2.3 Scope of Subsequent Releases:

The following features are planned for future versions of the Job Board after the core platform is stable and has gained enough users:

- **In-app messaging:** Allow Job Seekers and Company Representatives to communicate directly through the platform.
- **Paid and premium job listings:** Add paid job posting options and other monetization features to support the future growth of the platform.
- **Dedicated mobile application:** Develop a mobile app to make the Job Board easier to access and use on smartphones.
- **Advanced analytics and reporting:** Add dashboards and reports that provide useful information about the hiring process, such as application trends, hiring progress, and time taken to fill positions.
- **Advanced skills-based matching:** Improve the matching system to provide better job recommendations based on a user's skills, experience, and job requirements.

2.4 Limitations and Exclusions:

The following features are not included in the initial release of the Job Board and are planned for future versions:

- **Online payments:** The initial release will not support online payment processing or paid job listings.
- **In-app messaging:** Job Seekers and Company Representatives will not be able to chat or message each other directly through the platform.
- **Mobile application:** The platform will be web-based only in the initial release. A native mobile application is not included at this stage.
- **Advanced analytics:** Detailed analytics and reporting dashboards will not be available in the initial release.

3. Business Context:

Business context describes the people, priorities, and environment surrounding the Job Board project, so the development team understands who is involved, what they expect, and how the system will be used.

3.1 Stakeholder Profiles:

<u>Stakeholder</u>	<u>Role / Responsibility</u>	<u>Interest / Expectation</u>	<u>Influence on Project</u>
Job Seeker	End user searching and applying for jobs; maintains a profile with skills and resume.	Fast, relevant job discovery and a simple application process.	Medium usage and feedback shape usability priorities.

Company Representative	Registers a company, posts jobs, reviews applications.	Reliable access to qualified candidates with minimal effort.	High drives requirements for job posting and applicant review features.
Admin	Verifies companies, manages users, moderates postings and skills.	Platform integrity, trust, and data quality.	High approval authority controls what enters the platform.
Development Team	Designs, builds, tests, and deploys the system.	Clear, stable requirements and a realistic scope.	High technical feasibility shapes what is delivered.
Project Supervisor / Client	Reviews progress, approves requirements and scope decisions.	On-time delivery of a working, well-documented system.	High final authority on scope and acceptance.

3.2 Project Priorities:

The following priorities will guide the development of the Job Board and help determine where time and resources should be focused:

- **Security and data integrity:** Protect user accounts, resumes, personal information, and company data from unauthorized access or loss.
- **Core functionality:** Make sure important features such as registration, company verification, job posting, and job applications work properly from start to finish.
- **Usability:** Keep the platform simple and easy to understand so that Job Seekers and Company Representatives can use it without needing special training.
- **Performance and reliability:** Ensure that the system remains responsive and available during normal usage.
- **Additional features:** Features such as messaging, advanced analytics, and mobile support will be considered later, after the core platform is stable.

3.3 Deployment Considerations:

- **Platform:** The Job Board will be deployed as a web application that can be accessed through modern web browsers on both desktop computers and mobile devices.
- **Hosting:** The backend and database will be hosted on a cloud platform, while the frontend will be hosted separately. The frontend will communicate with the backend through secure HTTPS connections.
- **Connectivity:** An active internet connection will be required for all users, including Job Seekers, Company Representatives, and Admins.
- **Accounts:** Each user must create an account with a specific role. Company Representatives will also need to provide a valid company registration number during registration or verification.

- **Security:** The system will use JWT access and refresh tokens for authentication. Sensitive endpoints will be protected using role-based authorization. User passwords will be securely hashed and will never be stored in plain text.
- **Training:** The platform will have a simple and self-explanatory interface, so no formal training will be required for users or staff.
- **Data Migration:** Data migration is not required because the Job Board is a new system and does not depend on any existing or legacy data.
- **Integration:** The initial release will not include integration with external HR, payroll, or other enterprise systems.
